

Region 1 Knowledge System

A fully functional Region 1 knowledge system turns fragmented source, authority, evidence, and forest-plan data into a structured relational graph. It supports defensible, efficient land exchange execution now through NEPA review, with the same foundation ready to expand into additional workflows.

Current Region 1 knowledge graph surface.

From fragmented data to structured knowledge

Source records, authority logic, evidence traces, and forest-plan data resolve into a governed Region 1 graph for land exchange execution.

Reusable value: turn fragmented Region 1 knowledge into a governed execution system.

What the system organizes

- Source records, artifacts, and evidence spans.
- NEPA, USDA, Forest Service, and Forest Plan authority.
- Forest-plan profiles, components, and readiness state.
- V1 review outputs that can be traced back to source data.

Why it matters

Teams can prepare packages faster, inspect support paths, and extend the same graph foundation to new services.

Trace Every Output to Governed Evidence

Each capability is generated from governed sources. The trail runs from workbook scope and artifact hash to evidence span, source claim, authority decision, and output.

Evidence trace

Every generated output remains linked to source identity, text evidence, authority status, and the graph record.

Backward checks test the output against the record.

The trace exposes missing evidence, stale authority language, and unresolved applicability.

Outputs generated from the trace

Traceability model: the output is the end of a chain, not a free-standing conclusion. The same path supports reports, QA replay, graph views, and reverse checks.

Source boundary

Workbook scope, exclusions, partitions, catalog records, and hashes determine which materials can support review logic.

Reverse check

Generated outputs can be tested backward for unsupported claims, stale authority dependencies, missing support, unresolved applicability, and forest-plan gaps.

NEPA, USDA regulations, forest plans, and source evidence in one graph

The Region 1 graph presents NEPA authority, USDA regulations and procedures, source evidence, review views, and forest-plan data as connected layers without collapsing them into one undifferentiated network.

Region 1 graph control model

A reduced industrial view of the graph: distinct layers, conduit paths, and readable depth.

Forest plans stay separate

Forest-plan profiles and components are represented as their own layer, with readiness linked into review context instead of mixed into NEPA authority.

Authority and evidence stay inspectable

NEPA and USDA authority remain visible beside source records and evidence traces so reviewers can inspect the basis for a finding.
