

Make NEPA Review Risk Visible Early

This is not a visualization or report generator. It is an auditable NEPA review engine that makes review risk visible early. It connects source material, authority, evidence, findings, and forest-plan readiness before a package reaches decision, objection, litigation, or consultant rework.

Current Region 1 graph surface.

What the engine shows

- Which NEPA, USDA, and Forest Service authorities apply.
- Which authorities were screened out and why.
- Where each finding came from in the source record.
- Whether Forest Plan consistency is supported.

Why it matters

Risk becomes visible while there is still time to fix source gaps, unsupported claims, stale authority language, and forest-plan profile blockers.

Trace Every Finding to Governed Evidence

The engine preserves the full path: source contract, evidence span, authority decision, finding. That path powers compliance review, reverse compliance, decision support, final QA, and graph exploration.

Finding trace

The review product is only the final view. The underlying path stays inspectable from source record to finding.

Reverse compliance uses the same path in the opposite direction.

Unsupported claims, stale authority language, missing evidence, and unresolved applicability are flagged before readiness.

Outputs generated from the trace

Traceability model: the finding is the end of a chain, not a free-standing conclusion. The same chain supports reports, QA replay, and graph exploration.

Source governed

Workbook scope, exclusions, source partitions, catalog records, and artifact hashes define what can support review logic.

Reverse compliance

The evidence model flags unsupported claims, older-regulation dependencies, missing source support, unresolved applicability, and forest-plan gaps.

NEPA, USDA regulations, and forest plans in one graph

The Region 1 graph is the client-facing surface for the system. It shows NEPA authority, USDA regulations and procedures, source evidence, and forest-plan layers as connected but distinct parts of the review universe.

Separate forest-plan layer

Forest-plan profiles and components are graphed separately from NEPA and USDA authority, then linked into review context when ready.

Authority layer

NEPA authority, USDA procedures, and regulatory families stay visible beside source evidence so reviewers can inspect how findings are supported.
