

Scope Ready NEPA Work Packages

We turn a proposed-action intake into a contract-ready Project SOW requirements package before a complete EA review package exists. The workflow selects resource scopes, builds an intake evidence graph, renders required and optional deliverables, exposes reviewer adjudication, and hands accepted packages forward into EA assembly planning without creating legal conclusions or final agency decisions.

Current operational proof: 3 proving intakes, 0 failed cases, 0 system misses, and 0 intake omissions.

Planning model

The system reads structured proposed-action evidence and turns it into resource-specific SOW work, data needs, deliverables, assumptions, dependencies, acceptance criteria, reviewer roles, review timing, and signoff fields.

Boundary model

The output is a planning and contracting support artifact. It does not decide applicability, generate compliance findings, provide legal advice, prove legal sufficiency, or make a final agency decision.

From proposed action to SOW scope

The package records how each proposed-action element and evidence reference triggers a resource area and how that resource area resolves to a SOW scope. That keeps scope selection inspectable before specialist work is contracted.

East Crazies evidence graph: 115 nodes and 134 edges connect project, proposed action, action elements, evidence refs, resource areas, SOW scopes, required deliverables, and observed reports.

Defensibility shown

Every proposed-action-derived resource area is expected to keep the planning path: proposed action -> action element -> evidence ref -> resource area -> SOW scope.

Review signal

Validation fails closed on unsupported resource areas, dangling graph edges, observed reports without proposed-action support, missing SOW content, and missing reviewer-facing package sections.

Turn resource screening into work statements

Resource scopes are not just labels. Each selected scope carries SOW tasks, data needs, required and optional deliverables, defensibility checks, assumptions, dependencies, acceptance criteria, reviewer role, review timing, and signoff fields.

Contract-ready scope library

● **NEPA project management**
nepa_project_management / 3 required, 3 optional

● **Forest Plan consistency**
forest_plan_consistency / 3 required, 3 optional

● **Cultural/tribal resources**
cultural_tribal_resources / 3 required, 3 optional

● **Roads/access/recreation**
roads_access_recreation_designated_areas / 3 required, 3 optional

● **Minerals/hazmat**
minerals_energy_hazardous_materials / 3 required, 3 optional

● **Lands/realty land exchange**
lands_realty_land_exchange / 3 required, 3 optional

● **Wildlife/species/botany**
wildlife_species_botany / 3 required, 3 optional

● **Hydrology/wetlands/water**
hydrology_wetlands_water_quality / 3 required, 3 optional

● **Vegetation/soils/air**
vegetation_soils_air_quality / 3 required, 3 optional

● **Public involvement**
public_involvement_coordination / 3 required, 3 optional

30 required deliverables

30 optional deliverables

Reviewer roles, timing, signoff fields

Current scope library: 10 resource SOW templates. East Crazies selects 10 scopes, all with contract fields, required deliverables, optional deliverables, and rendering checks passed.

What is inspectable

Scope records keep tasks separate from deliverables and keep assumptions, dependencies, acceptance criteria, reviewer role, timing, and signoff fields explicit for contracting review.

What this prevents

Optional deliverables cannot satisfy the required-deliverable gate, and selected scopes without contract fields fail validation before package use.

CAPABILITY 3 / EVALUATION, ADJUDICATION, AND HANDOFF

Close the planning loop before EA assembly

The operational lane validates intakes without writing outputs, runs the proving-intake eval, checks generated package renderings, exposes reviewer adjudication for unresolved planning items, and converts an accepted package into a downstream EA assembly checklist.

Operational gate proof: 13/13 gate checks passed. The East Crazies handoff emits 27 future EA assembly slots across source collection, specialist reports, public involvement, consultation, Forest Plan consistency, and decision-record support.

Intake validate

No-write validation for templates and proving intakes.

Package render

Canonical JSON plus Markdown/PDF SOW package renderings.

Operational gate

Eval, rendering smoke, docs/schema checks, and output hashes.

Draft intake

Plain-text proposed actions become unreviewed drafts for confirmation.

Adjudication

Reviewer worklist and replay path for planning decisions.

EA handoff

Future assembly slots without claiming artifacts exist now.

What this service delivers

- Structured proposed-action intake and validation before package generation.
- Resource SOW requirements package with contract-ready scope records.
- Reviewer adjudication for calibration gaps and optional deliverable decisions.
- Downstream EA assembly checklist tied to the accepted package JSON.

Current boundary: the Project SOW lane scopes work needed to prepare a defensible EA package. It does not run downloader, extraction, applicability, generated rule-pack, compliance review, phase-eval, legal sufficiency, or final agency decision workflows.
