

NEPA Scope of Work System

This system turns a structured proposed-action intake into a contract-ready scope of work package. It explains why resource workstreams are selected, renders the work needed from each resource area, and carries reviewer decisions forward without converting planning support into compliance conclusions.

Purpose

Scope of work development is a common project bottleneck. Agency staff may inflate resource-area requirements beyond what laws, regulations, and project facts require. This system identifies only the required work and excludes preference-driven additions.

Overall system facts

Structured intake
Captures proposed action, project profile, resource indicators, evidence references, and review assumptions as data.

Traceable selection
Shows why resource workstreams were selected and where reviewer confirmation is still needed.

Contract package
Outputs tasks, data needs, deliverables, acceptance criteria, roles, timing, and signoff fields.

Planning boundary
Keeps scope planning separate from compliance determinations, legal conclusions, and future EA artifacts.

What the model produces
Resource-specific work records that distinguish tasks, data needs, deliverables, assumptions, dependencies, acceptance criteria, reviewer roles, timing, and signoff.

What reviewers control
Unresolved selections, optional deliverables, and handoff readiness remain visible as adjudication items before the accepted package moves into EA assembly planning.

Traceable planning package before EA assembly

The design keeps three things explicit: the evidence path from proposed action to selected resource scope, the contract fields needed to order specialist work, and the reviewer gate that decides what is ready to hand off.
