

NEPA review service, made auditable

We provide professional NEPA reviews for projects using a graph-backed evidence process. The USFS Region 1 source library is the worked example: we update the authority graph with the most current applicable regulations and procedures, test applicability, run Forest Plan and full profile consistency review, trace evidence, flag older-regulation dependencies, and package decision support for the responsible official.

NEPA review service process mapped as evidence

Our review process links document inputs, current agency procedures, source evidence, and review decisions - not unsupported conclusions.

Why this matters for a service engagement

USFS Region 1 is the worked example. The same process can be run against another NEPA document package by refreshing the authority graph with the most current applicable regulations, mapping project evidence, testing reverse compliance, preparing consistency **Example validation passed: 75 graph checks; 33 applicable and 340 non-applicable authority decisions.**

Current-authority model

The authority graph is updated with the most current applicable regulations, USDA and Forest Service procedures, source records, directives, forest-plan components, applicability decisions, and readiness blockers instead of flattening them into a narrative answer.

Decision-support model

Each service finding is backed by graph-export validation. The V1 Region 1 example passed 75 graph checks and links generated rules and compliance findings back to source records, evidence spans, and review-specific applicability decisions.

From authority graph to decision support

For any NEPA document package, the process updates the authority graph with the most current applicable regulations and separates current applicable authorities from authorities that were considered but screened out. That makes the review politically legible and defensible.

Applicability is the first review gate

For any NEPA document set, our review process builds an authority graph, separates current applicable authority from screened-out authority, and generates evidence-backed findings.

Service value shown

- Defensibility: non-applicable and screened-out authorities are preserved, so the review explains what was considered and why it was not used.
- Reverse compliance: draft document claims can be checked against the authority graph and flagged when unsupported or based on older regulation language.
- Validation: 75 graph checks passed before this view was exported.

Applicability scene: 373 candidate authority decisions, 33 applicable, 340 non-applicable. The image preserves the graph distinction between candidate authority, review decision, generated rule, and compliance finding.

Defensibility shown

Non-applicable authorities stay in the graph, so the reviewer can explain what was considered and screened out instead of only showing final inclusions.

Responsible-official support

The output shows a visible path from authority graph to decision, rule generation, and compliance finding rather than a black-box conclusion.

From source record to authority graph

A responsible official or review team should be able to ask where each authority and finding came from. The evidence view turns source records, citation labels, extracted spans, and rule templates into a traceable authority graph before findings are used for decision support.

A finding is a traceable evidence path

This Region 1 example is generated from one actual graph trace: source authority, rule template, applicability decision, generated rule, evidence span, and compliance finding.

What the review team can inspect

- Authority family: Administrative review, objection/appeal, and final agency action
- Source citation: R1EA-021 (c05d819e514a)
- 99 support edges link generated rules or evidence spans to compliance findings across the V1 overlay.

Evidence path scene: one actual source-record -> rule-template -> applicability-decision -> generated-rule -> compliance-finding path is derived from graph edges, with the evidence span kept visible.

What is inspectable

Source records, citation labels, extraction spans, applicability decisions, generated rules, and findings all remain separate graph objects with explicit support edges.

What this proves

The service is not just a visualization. It shows that findings can be traced back to the repo evidence model and the validated local graph export.

Find gaps before they become decision risk

Our review workflow supports forward review and reverse compliance. Most EAs receive a Forest Plan consistency document; we extend that into a full profile consistency document across applicable laws and authorities, then package decision support for the responsible official.

Readiness controls prevent overclaiming

The USFS Region 1 example shows a ready Custer Gallatin profile while keeping broader Region 1 blockers visible.

Service value

- 1 graph-ready forest profile and 9 blocked forest profiles are visible in one view.
- The review process can show capability now without implying that every Region 1 profile is ready for service delivery.

Readiness scene: blocked profiles and missing-source requirements are graph objects. The USFS Region 1 example shows Custer Gallatin as ready while preventing broader Region 1 completeness claims.

Document intake

Draft NEPA package, appendices, catalog records, and provenance.

Current authority graph

Most current applicable regulations, agency procedures, source records, and authority families.

Applicability

Document-specific applicable and screened-out authorities.

Reverse compliance

Unsupported claims, stale references, and missing evidence.

Consistency document

Forest Plan consistency plus full profile consistency across applicable laws.

Decision support

Responsible-official briefing with findings, gaps, and evidence paths.

What this service demonstrates

- Review any NEPA document package against an authority graph updated with the most current applicable regulations.
- Identify unsupported or older-regulation-based statements through reverse compliance.
- Retain screened-out authorities for defensibility and political legibility.
- Provide responsible-official decision support with evidence paths and residual risks.

Currentness boundary: older implementing-regulation language is treated as a review risk and flagged outside the current NEPA review basis unless supported by current agency procedure or another current project-specific authority. The graph visualizes the validated USFS Region 1 source set and review overlay; it is not a substitute for legal review.
